

NovaMart Retail — Portfolio Case Study

1. Business Problem

NovaMart Retail needs to understand profitable growth and identify the drivers and risks behind revenue and profitability.

2. Analytical Approach

Source data → Data Quality → Cleaning → KPI Layer → Business Analysis → Advanced Analysis → Dashboard → Insights → Recommendations → Validation.

3. Analysis Areas

- Sales and time performance
- Product performance
- Category and subcategory performance
- Regional performance
- Customer and RFM analysis
- Discount analysis
- Product Pareto
- Customer Pareto

4. Business Outcome

The analysis identified technology as the revenue and profit leader, furniture as the weakest-margin category, West as the revenue-leading region, and Central as the weakest-margin region. Product and customer concentration were quantified through Pareto analysis, while loss-making products were identified for review.

5. Data Integrity

The dataset was treated at line-item grain. No rows were deleted during cleaning. Negative-profit records were retained. Discount analysis is descriptive rather than causal.

6. Important Limitation

The supplied source has no returns data, unit cost, store ID, or channel field. These dimensions were not fabricated.

7. Portfolio Positioning

This case study demonstrates end-to-end business analytics thinking: establishing data grain and quality first, defining trusted metrics, analyzing business drivers, validating results, and translating evidence into recommendations.
